Ten Reasons to Drink
More Water

The record isn't broken, but on the side of precaution we need to discuss maintaining hydration during these tough summer months. As we have written in the past – the medical experts continue to promote **Water** for remaining hydrated during these warm and/or hot summer times opposed to energy and sports drinks. Following are some facts that will really re-enforce the fact that drinking more water is the best alternative for you.

The Ririan project, a company involved in a variety of medical, health and scientific research projects, has developed a paper on the 10 best reasons why drinking **Water** is good for you and that we should make **Water** an integral part of our daily routine. Following is an explanation from the “Ririan Project” on the 10 best reasons to drink more **Water**:

- ✓ **GET HEALTHY SKIN** – Nothing improves the appearance of skin better than consuming sufficient amounts of **Water**. The female population spends a lot of money on cosmetics, but **Water** is the single most important element for cellular integrity by moistening the skin and helping to maintain elasticity. This statement was made by the Ririan researchers that the real fountain of youth can be found in a glass of **Water**.
- ✓ **FLUSH TOXINS** – **Water** helps to remove toxins from the body, particularly in the digestive tract. Our kidneys have a filtering system capability that is totally dependent on **Water** for it to work. **Water** helps to remove ketones, nitrogen and urea. It is more important when a high protein diet is practiced because it is necessary to assist the kidneys in doing their job.
- ✓ **REDUCE THE RISK OF HEART ATTACKS** – *Researchers* at the Loma Linda University in California studied more than 20,000 healthy men and women and found that people who drink more than 5 glasses of **Water** each day are less likely to die from heart attack or heart disease than those who drank fewer than 2 glasses a day.
- ✓ **CUSHIONS AND LUBRICATES YOUR JOINTS AND MUSCLES** – **Water** makes up a large part of the fluid that lubricates and cushions your joints and muscles. Although this is not the only element associated with muscle cramps, athletes have long recognized that even mild hydration can produce muscle cramps. So, drinking an ample amount of **Water** each day, before, during and after work or exercise can help to reduce muscle cramps and premature fatigue. Some schools of thought promote “Gatorade’s” Propel water because the flavor is more attractive to drink. But drinking **Water** does the same thing. The flavor makes it more attractive to drink.

- ✓ **BURNS MORE FAT – BUILDS MORE MUSCLE** – Protein synthesis builds more muscles. Calories have 2 fates – either they get burned or they are stored. **Water** helps to control these fates.
- ✓ **GET ENERGIZED** – On the average, adults lose about 10 cups of liquid each day through sweating, urinating, exhaling, and bowel movements. Even minor hydrations can cause impaired concentration, headaches and fatigue. **Water** is essential for proper circulation throughout the body. When the body is well hydrated, the oxygen levels in the blood stream are greater. The more oxygen it has, the more fat it will burn for energy. Drinking sufficient amounts of **Water** every day will help you think more clearly. Research has proven that staying hydrated is necessary for the brain to function at optimum levels. Many schools are urging students to keep a bottle of **Water** at their desk.
- ✓ **STAY REGULAR** – **Water** helps to prevent constipation by adding fluid to the colon and bulk to the stool. As simple as it may seem, fluid plays a major role in preventing constipation. **Water** is essential for proper digestion, nutrient absorption, and chemical reactions. **Water** is critical as a vehicle to move nutrients through our bodies and to remove waste.
- ✓ **REDUCE THE RISK OF DISEASE INFECTIONS** – Failure to drink enough **Water** will cause cellular dehydration, resulting in weakened immune system. Michaud and his staff found that in a 10-year study of 48,000 men that the incidence of cancer found in the urinary bladder was greatly reduced by a high-intake of fluids. The top 20% drank 2,500 ml. per day or more. The bottom 20% drank 1,200 ml. per day or less. Their conclusion was that the risk of cancer decreased by 7% for every 240 ml of fluid added.
- ✓ **REGULAR YOUR BODY TEMPERATURE**– **Water** regulates the body’s cooling system. Sports drinks are useful when consumed during vigorous exercise, but experts agree that **Water** works better for moderate work or exercise. **Water** is a nutrient that the body needs the worst.
- ✓ **GET WELL**– **Water** plays a role in nearly every body function. It helps to control fever, replaced lost fluids, and thins out mucus. The body absorbs 4 oz. of **Water** every 10 minutes, so we should drink a glass every hour that we are awake.
